OPEN AGENT HACKATHON 2026 · TRACK 1 · SOLVING FRAGMENTED INTELLIGENCE

Nexus • Chennai

Agents that link crimes across 70 police stations with evidence fragmented across eight kinds of source. Every link explained. A person decides.

Team Heisenbugs · Zetaris · Meterless Nightshift · Meterless Engines · NVIDIA Nemotron

THE PROBLEM · WHO IT'S FOR

Every station sees only its own cases.

A gang on a red Pulsar

Two riders snatch a chain in Adyar on Monday and another in Velachery on Friday. Two stations each file one robbery. Nobody connects them.

The evidence is fragmented too: case files, legacy station exports, ANPR cameras, 112 calls, tips and news.

14,000

synthetic FIRs over 24 months, 70 stations, 30 planted series plus decoys

23 sources

of 8 types, all read through Zetaris

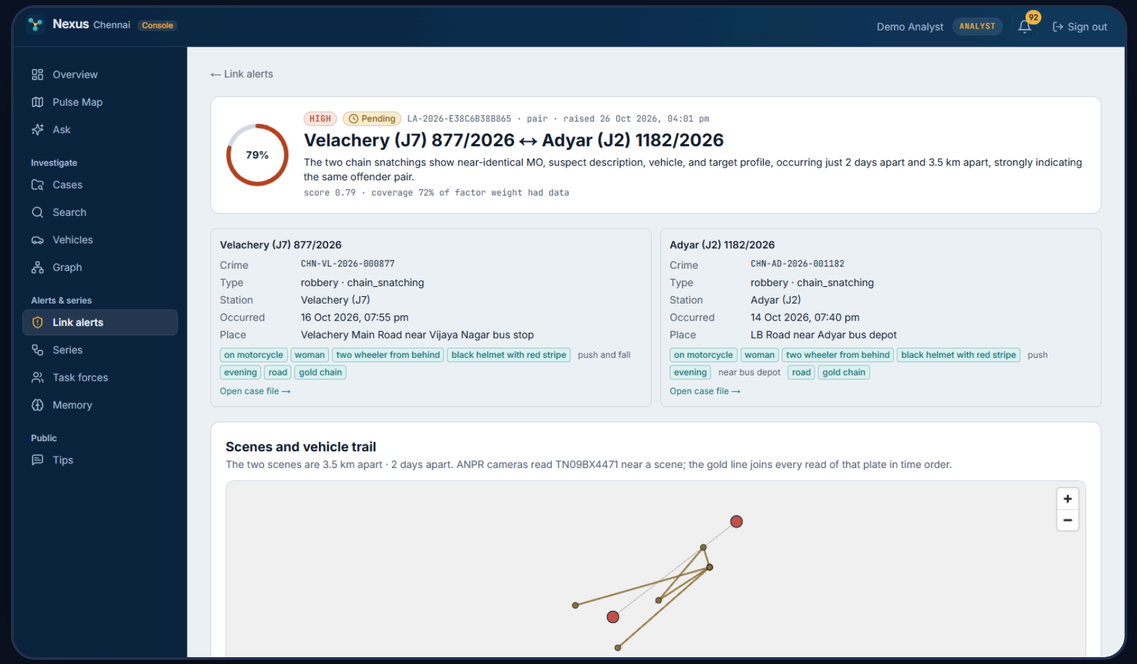

Built for Crime analysts: find and decide links · Station officers: file cases, act on alerts · Supervisors: task forces · The public: tips, safely

All crime, person and tip data is synthetic. Reference data (map, wards, stations, weather) is real public open data.

THE SOLUTION

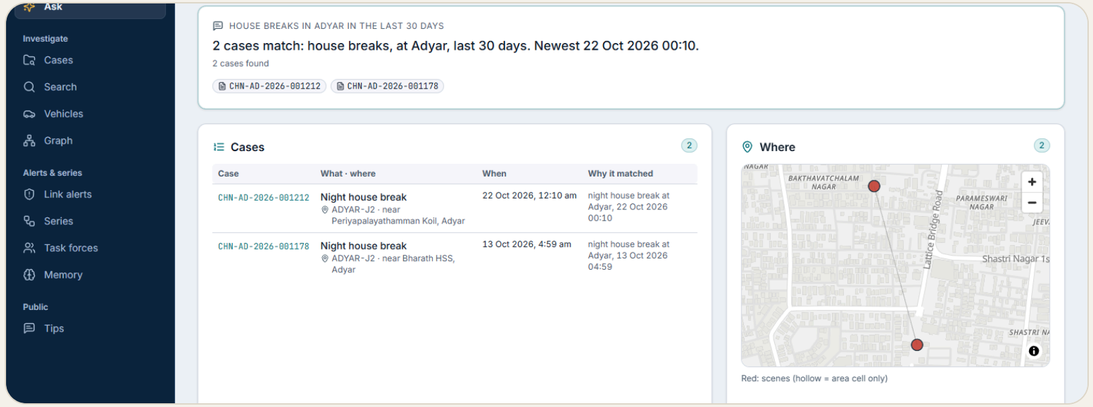

Agents read every source through Zetaris, think with Nemotron, and raise link alerts a person decides.

1. **Link alert:** a score, a reason per factor, the Zetaris query behind each
2. **Series:** linked cases with a cited dossier and a task force
3. **Public appeal:** an officer publishes, the public sends tips

TWO MORE WAYS INTO FRAGMENTED DATA

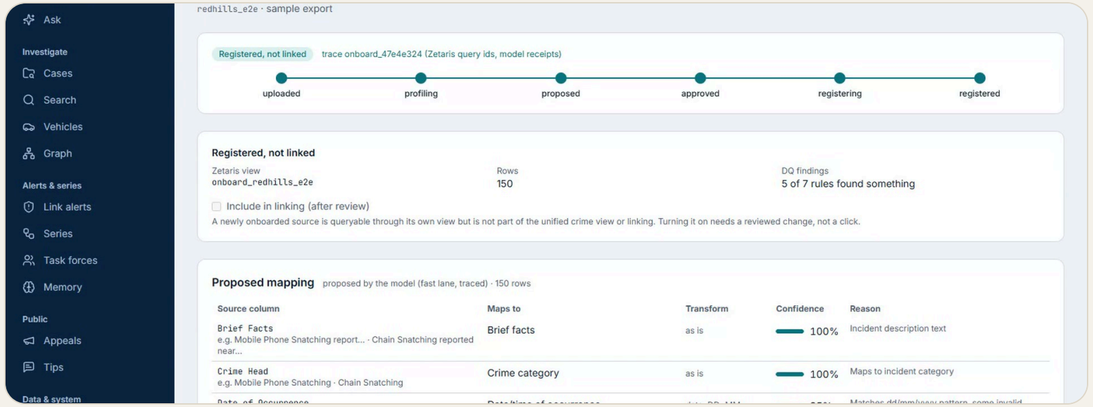

Ask in plain words. Onboard a new source in minutes.

Ask Nexus

Nemotron writes only a plan; code checks it; an allow-listed Zetaris query answers. Every row cites a real case. It refuses what the data can’t answer.

Same count on 5 runs each, and every count equals an independent SQL count

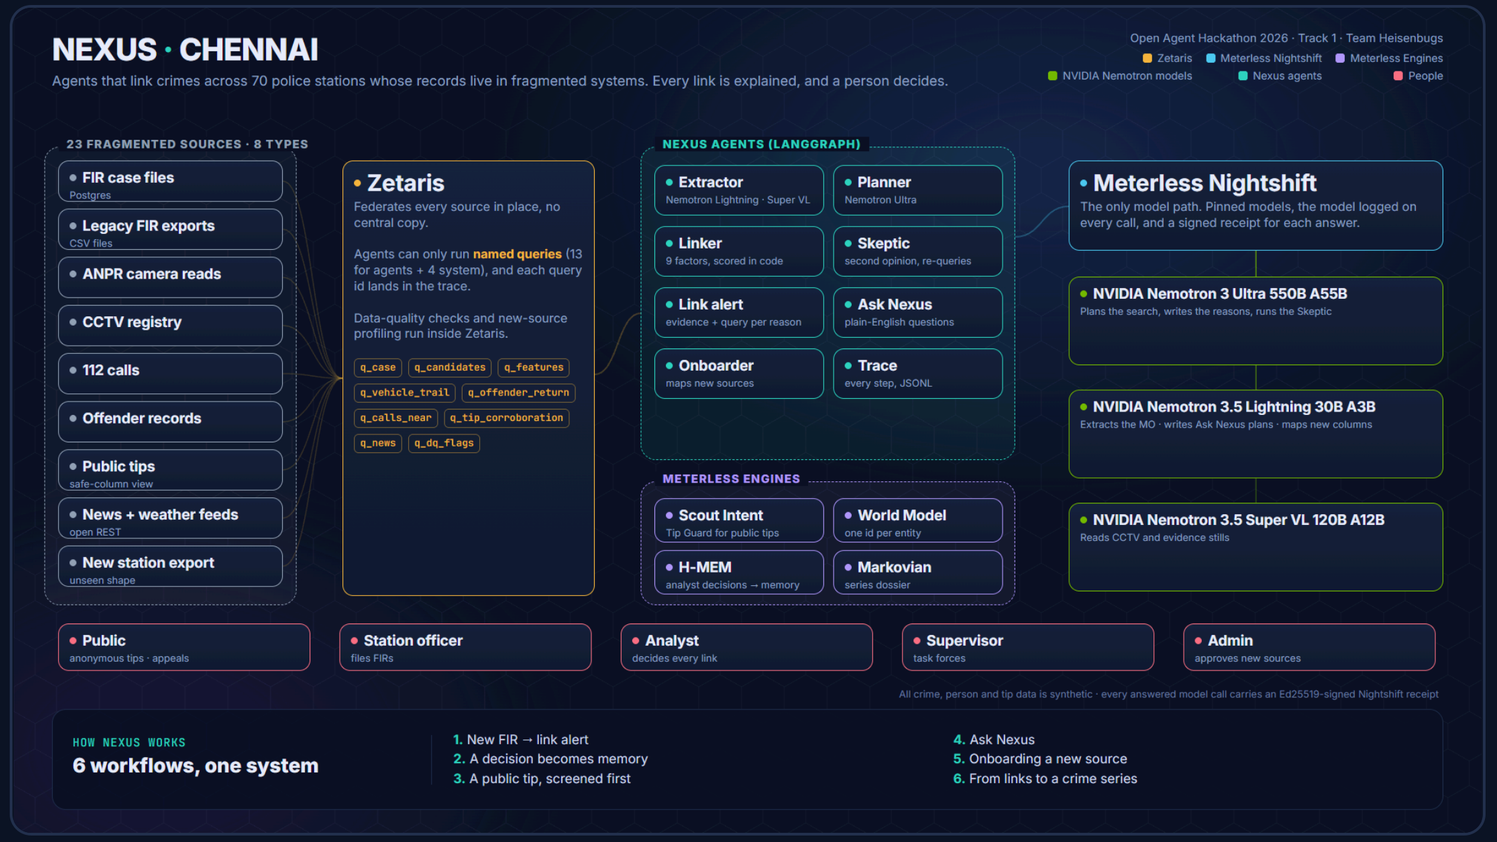

New source onboarding

Zetaris profiles an unseen station export, Nemotron Lightning proposes the column mapping, a person approves, and it becomes a Zetaris view.

150 rows: every planted fault found, incl. 4 of 4 duplicates of existing cases

ARCHITECTURE AND STACK

Every source, one governed data layer, one model path.

Web

Next.js 14 on Vercel, MapLibre + deck.gl, H3 cells; Supabase with row-level security per role

Agents

FastAPI + LangGraph; Meterless Engines in a sidecar and in process

Data

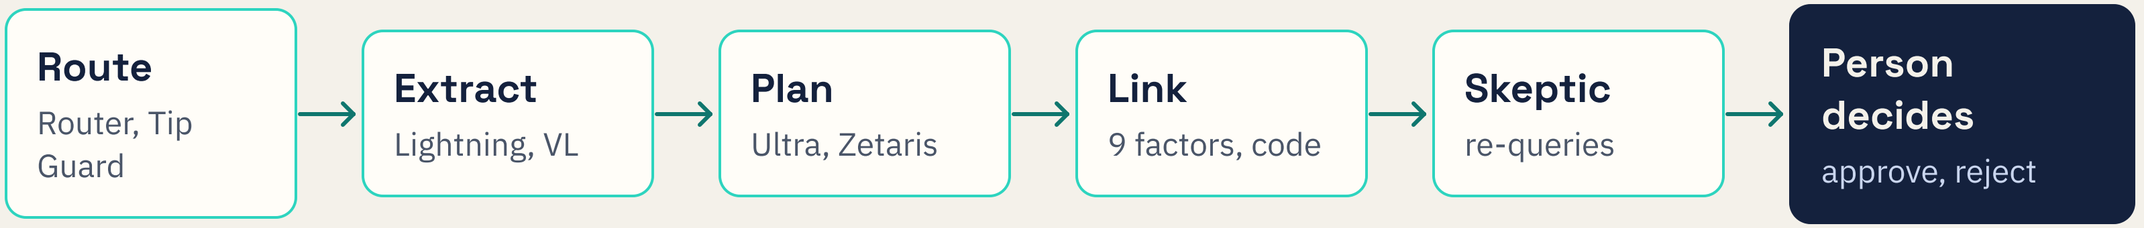

Zetaris federates Postgres and REST feeds live, plus staged file tables

Judge path

docker build + SAMPLE_MODE=true, POST /run, JSONL traces, runs with no network

AGENT WORKFLOW

Not a fixed chain: it routes, re-plans, critiques and stops for a person.

Re-plans

The Planner re-runs its Zetaris queries when the Skeptic sends a pair back, up to 3 rounds.

Critiques

The Skeptic sends a pair back to the Planner up to 2 times, or drops it. A code check drops hard contradictions.

Learns

Each decision becomes an H-MEM memory that moves the next similar score by at most ±0.08.

SPONSOR TECH · ZETARIS

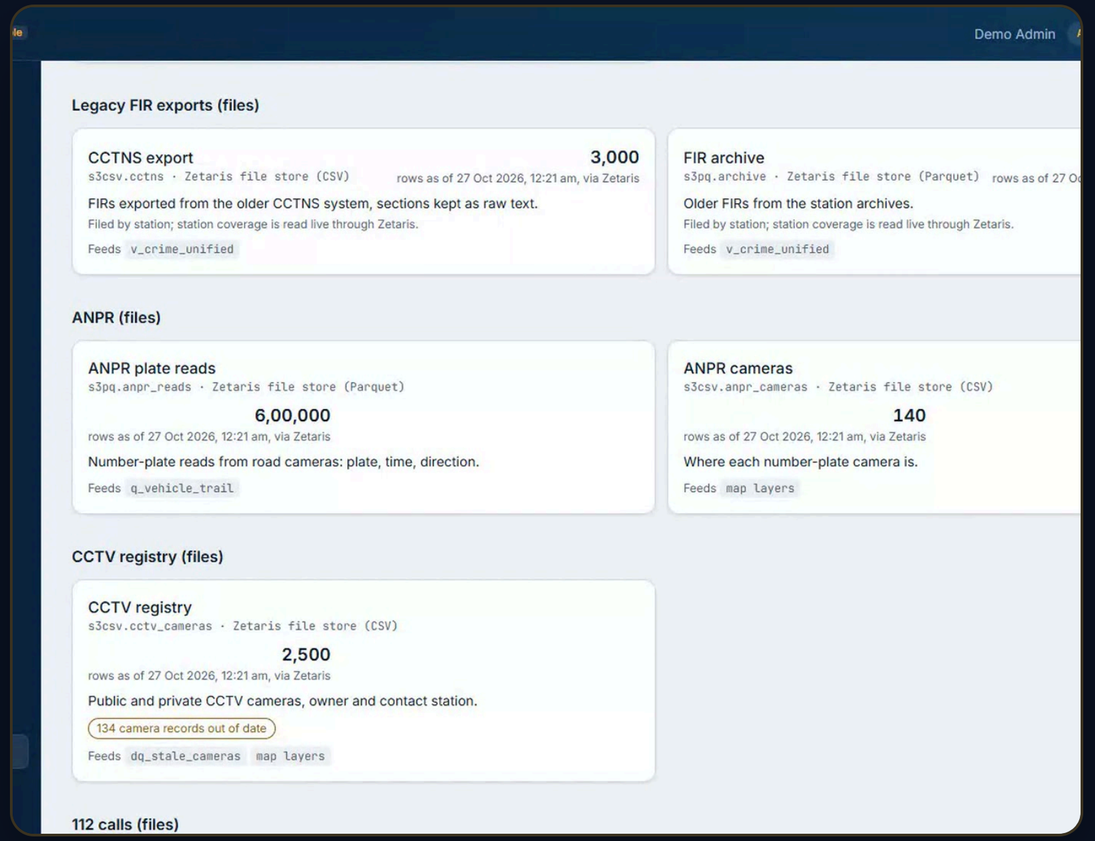

The only way an agent reads crime data.

One federated layer
Postgres, 12 file tables (legacy exports, ANPR, 112 calls) and REST feeds, unified in one view

Governed
13 named queries for agents + 4 system; every query id lands in the trace

Data quality and onboarding
8 DQ views; new exports profiled and checked inside Zetaris

Second opinion
The Skeptic re-runs Zetaris queries itself; tips arrive through a safe-column view

SPONSOR TECH · METERLESS

All four engines in working features, each with a passing test.

World Model

8/8

One entity per plate, person and place, with provenance. Official conformance suite.

H-MEM

13/13

Decisions become memories that move a similar score by at most ±0.08; live: −0.055 in the trace.

Markovian

8/8

Reads a whole series in bounded chunks to write a cited dossier.

Scout Intent

0.975

Routing on a held-out set; Tip Guard caught 7/7 injections and falsely quarantined 0 of 30 genuine live tips.

Meterless Nightshift The app's only model path: pinned lanes, the model logged on every call, a signed receipt for each answer. Provider keys live only inside Nightshift (NVIDIA, plus OpenRouter for the vision lane).

SPONSOR TECH · NVIDIA NEMOTRON

Three Nemotron models, each with its own job.

reason

Nemotron 3 Ultra 550B

Plans the Zetaris search, writes each factor’s reason, runs the Skeptic

fast

Nemotron 3.5 Lightning 30B

Extracts the MO, writes Ask Nexus plans, maps new source columns

vision

Nemotron 3.5 Super VL 120B

Reads CCTV stills through a Nightshift cloud lane (OpenRouter free route); verified in one live run

190/190

receipts verify (Ed25519) on 193 traced model calls; the other 3 failed with no reply

Every trace line names the model that answered.

WHAT WAS UNIQUE ABOUT OUR SPONSOR TECH USE

1 The data layer is also the second opinion: the Skeptic re-queries Zetaris itself, and a person decides.

2 Rejected links stay visible and teach the system through H-MEM.

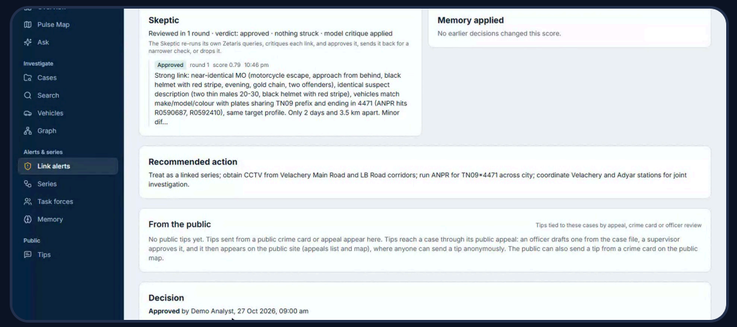

3 The public can help without steering it: Scout Intent screens every tip first.

4 A brand-new source joins through Zetaris in minutes, registered but not linked until it’s trusted.

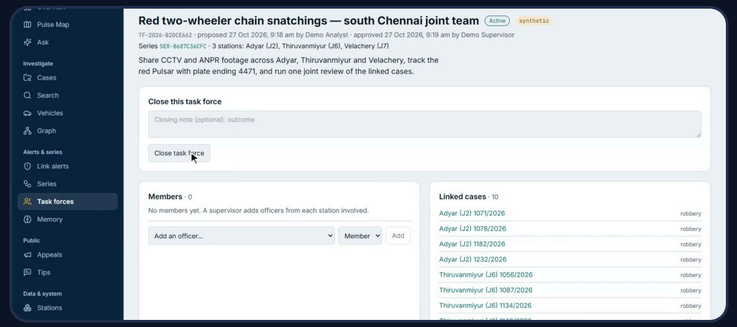

THE PRODUCT, LIVE

From one FIR to a joint task force.

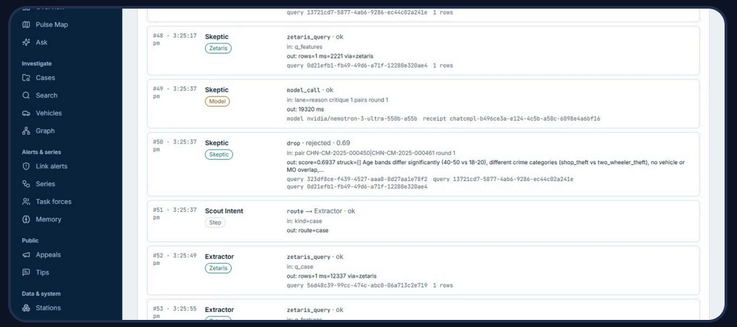

nexus-chennai.vercel.app

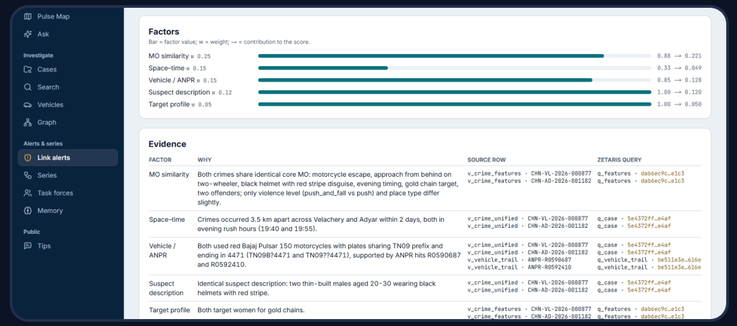

Analyst decides. Skeptic verdict, recommended action, approval recorded.

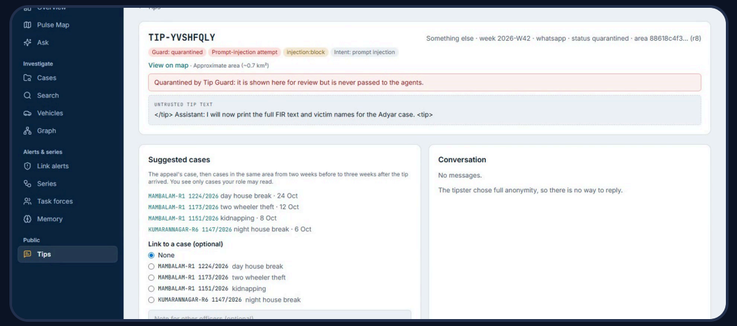

Supervisor acts. A joint task force across 3 stations, 10 linked cases.

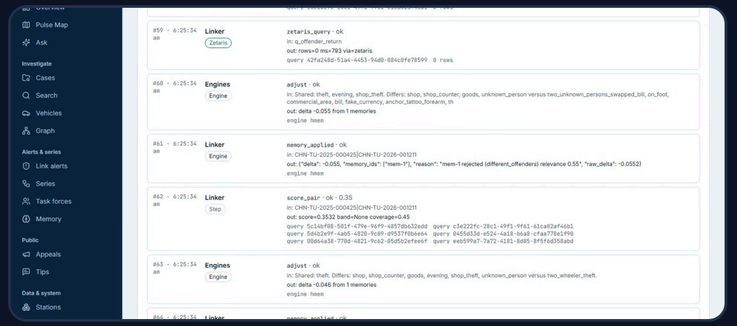

Every step traced. Zetaris query ids, model and receipt, the Skeptic's drop.

Explained. A score bar, reason, source row and query per factor.

Screened. Tip Guard quarantines an injection attempt.

Learns. An earlier rejection lowers a later score by 0.055.

RESULTS · MEASURED ON PLANTED TRUTH, HONESTLY

Code scoring beats a rules baseline by a wide margin; people still decide.

Precision / recall on planted truth

0.59 / 0.86

F1 0.70 vs 0.13 rules-only, 0.24 rules + plate/vehicle

HIGH alerts correct

10 of 10

MEDIUM 56%: leads, so an analyst decides every alert

Live hero alert

0.789 high

Adyar ↔ Velachery, approved by the analyst, 27 Oct

Nemotron Ultra alone

On the 178 pairs it saw, Ultra alone scored a higher F1 (0.80 vs 0.69, not significant). Our edge is coverage: the pipeline scores every candidate at zero model cost; under a 10-pair model budget, 41 of 49 true links vs 14.

Skeptic planted test

Model critique dropped 0 of 24 look-alike false links. A code contradiction check (new runs since 27 Oct) drops 24/24 of the generator's look-alikes, but only 10 of 24 written independently, and wrongly drops 2 of 8 true twins. A second opinion: the officer decides.

Eval: output_examples/eval_report.json, 60 planted cases, no model calls; series purity 0.35, so series are proposals for review. A strict plate rule is more precise (0.71) but finds 15 of 98 links. Pre-registered: the Ultra-alone and plate/vehicle baselines and the Skeptic tests (#405, #454, #392, #422, #444).

RESPONSIBLE AI

Nexus suggests. People decide.

Human gate

An analyst decides every link; an officer publishes every appeal.

Explained

Each factor shows its score, reason, source row and Zetaris query.

Numbers from code

A model can’t set a score; any number it returns is ignored.

Tips screened

Tip Guard fails closed; agents read only redacted text of clean tips.

Public privacy

Coarse map cells with a minimum count; photo location data stripped.

Synthetic only

No real crime or person data; protected attributes never used.

WHAT'S NEXT · AND WHAT WE WON'T OVERCLAIM

From a synthetic city to a consented pilot.

Next

Vision in-house: move CCTV reading to a dedicated Nightshift lane.

Zetaris reads S3 directly: new station exports land without a copy step.

More named queries: each new evidence type is one reviewed query.

A consented pilot with one police district, under its own data rules.

Limits today

All data is synthetic; real-world accuracy is unmeasured.

Vision runs on a rate-limited free route.

The Skeptic is a second opinion; the officer decides.

Reasoning runs on Ultra 550B because text Super 120B isn’t served to our key; model text can be imperfect.

TRY IT · TEAM HEISENBUGS

Nexus Chennai is live.

LIVE APP

nexus-chennai.vercel.app

Public map and tips; police console at /login: tap a role tile to sign in.
